

Tutorial 7

Q1. What is the Greedy Algorithmic paradigm when should you should make use of Greedy Algorithms in problem solving?

→ Greedy Algorithm always makes the choice that seems to be the best at that moment. It makes a locally optimal choice in the hope that this choice will lead to a globally - optimal solution.

Used for optimization problems (maximization or minimization)

A problem should be solved in stages, as we get input we see if that can be fit in result.

Q2. Analyse the time and space complexity of following Algorithms -

① Activity selection -

$$TC = O(n \log n)$$

② Job Sequencing

$$TC = O(n^2)$$

$$SC = O(n)$$

③ Fractional Knapsack

$$TC = O(n \log n)$$

$$SC = O(n)$$

Huffman Encoding - $O(n \log n)$

Q3. A file contains the following characters and their corresponding frequencies as shown below.

a = 45 c = 22 e = 19

b = 23 d = 20 f = 15

~~f = 15~~ x]

~~e = 15~~ 19 x]

d = 20 x]

c = 22 x]

b = 23 x e

a = 45

ef = 34 x

cd = 42

bef = 57

acd = 87

abcdef = 144

a = 00

c = 010

e = 100

b = 11

d = 011

f = 101

a → 2 × 45 = 90

b → 2 × 23 = 46

c → 3 × 22 = 66

d → 3 × 20 = 60

e → 3 × 19 = 57

f → 3 × 15 = 45

364

Avg code length = $\frac{364}{144} = 2.52$

Q4. Which data structure is used while implementing Huffman Encoding? Answer of Huffman's Encoding: Heap (Min) is used for Huffman Encoding.

→ Mainstream compression from GZip, Pkzip and ZIP2 to JPEG, PNG.

Q5 Given weights and values of 7 items, put these items in a knapsack of capacity $W=15$, such that you get the maximum total value in knapsack.

Index	0	1	2	3	4	5	6
Value	10	5	15	7	6	18	3
Weight	2	3	5	7	1	4	1
V/W	5	5/3	3	1	6	18/4	3

① Take 6

$$P = 6$$

$$K = 15 - 1 = 14$$

② Take 5

$$P = 6 + 10 = 16$$

$$K = 14 - 2 = 12$$

③ Take 4.5

$$P = 16 + 18 = 34$$

$$K = 12 - 4 = 8$$

④ Take 3

$$P = 34 + 15 = 49$$

$$K = 8 - 5 = 3$$

⑤ Take 3

$$P = 49 + 3 = 52$$

$$K = 3 - 1 = 2$$

$$\textcircled{1} \text{ Take } 1.6 = 52 + 2 \times \frac{5}{3} = 52 + 3.3$$

$$P = 55.3$$

Q6 Prove that Fractional Knapsack problem and Huffman encoding has greedy-choice property.

at every step
In Fractional Knapsack, we choose the maximum value/weight value which is the best solution for attaining maximum profit in a given capacity.
Also in Huffman encoding we choose the two minimum according to our greedy condition so that it can be easily compressed.

Q7 Consider a set of activities given below, along with the starting and finishing time of each activity, find the maximum number of activities performed by a single person can only work on a single activity at a time.

	0	1	2	3	4	5
Start time	1	2	0	6	9	10
End time	3	5	7	8	11	12

- Q8 Consider the following jobs where every job has a deadline and an associated profit if completed within deadline. It is given that every job takes a single unit of time. Perform job sequencing such that you maximize the total profit if only one job can be scheduled at a time.

	a	b	c	d	e
Profit	20	15	10	5	1
Deadline	2	2	1	3	3

Profit = 20

+ 15

+ 5

40

① Pick 'a' (20)

② Pick 'b' (15)

③ Drop 'c'

④ Pick d (5)

40 (Total profit)

- Q9 Why should we avoid making use of greedy approach in problem solving?

Give Examples to support

Dijkstra's Algo with -ve weights.

If we decrease the value of edge, we will obtain a distance even further from actual minimum distance.

Travelling Salesman Problem - greedy strategy will find the worst possible solution.

- Q10 How can you optimize the approach used to solve job sequencing problem?

— Using Dynamic Programming by nullifying the approach of sorting.

— Time complexity reduces from $O(n^2)$ to $O(m \times n)$
